

Purpose:

We used open cv Haar cascades media pipe face mesh to detect faces then we used face-recognition.py to classify faces as either a known person or unknown. The detection answers "Is there a face here?" while the face recognition attempts to answer "Whose face is it?"

Method: Our method was adding one reference photo of me and Aurelio to the "Unknown faces" directory. The program created a facial encoding from each reference photo and compare it to the faces in front of the camera while the code runs.

Person	Condition	Expected Result	Real Result	Correct?
Aurelio	Bright light, facing cam	Aurelio	Aurelio	Yes
Aurelio	Low light	Aurelio	Don't know	NO
Aurelio	Face angled	Aurelio	Aurelio	Yes
Aurelio	Glasses/accessory	Aurelio	Aurelio	Yes
ME	Bright light, facing cam	ME	ME	Yes
ME	Low light	ME	Don't know	NO
Both of Us	Both in Frame	Both of Us	Aurelio	NO
Unknown	Facing cam	Unknown	Unknown	Yes

Reflection: While running the code it would compare and recognize me and Aurelio's face using the reference photos. It mostly worked in good lighting. Something we noticed was that it can't detect multiple face at the same time.
